

# Public Health Information Network Messaging System

A Standards Based Approach to Message  
Transport

M. Barry Rhodes, Ph.D.

Associate Director for Public  
Health Systems Development,  
IRMO, CDC

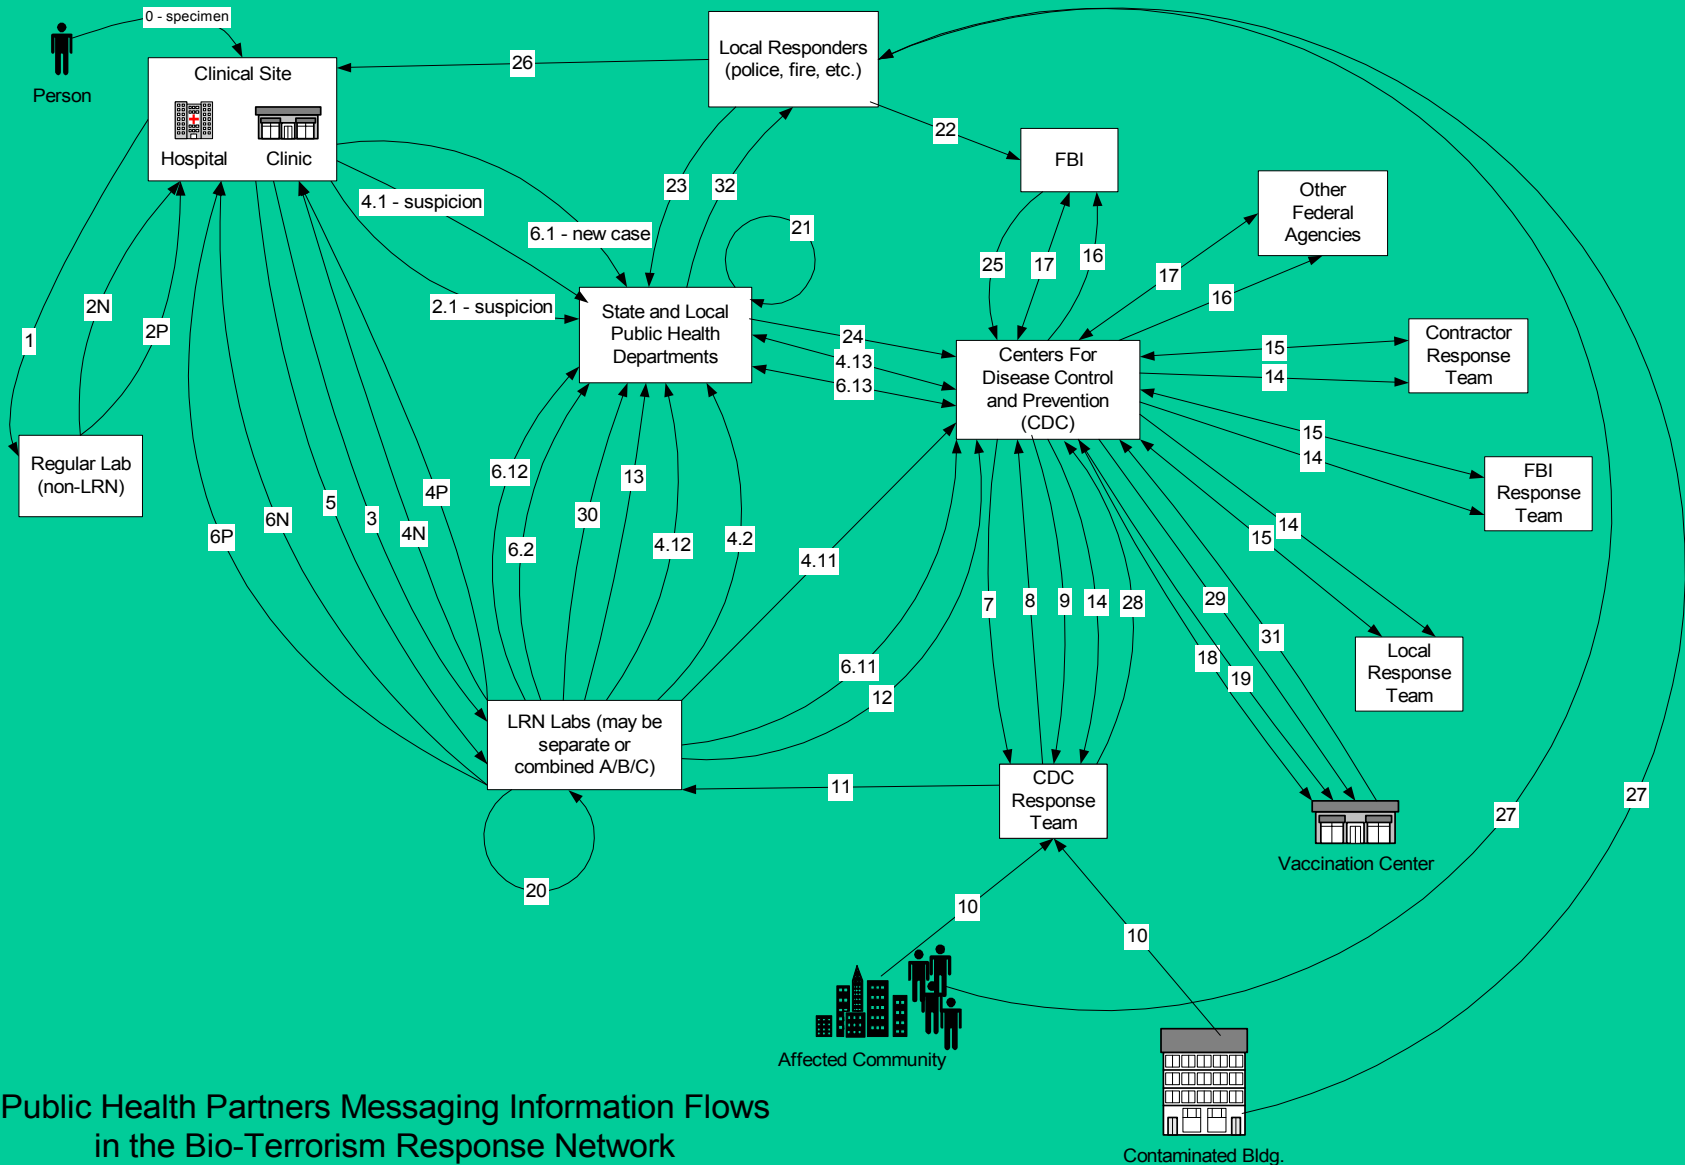

# PHINMS Vision

- Standards not software
- Interoperability across vendors, platforms, and jurisdictions
- A network where messages can be easily exchanged between labs, hospitals, physicians, researchers, public health officials, emergency responders, federal agencies, and the CDC in a secure, reliable manner

# PHIN Standards for Message Transport

- ebXML
- XML DSIG
- XML Encryption
- HTTP(S)
- PKI
- LDAP

# Why Do We Need Interoperability?

# About ebXML

- ebXML enables “a modular yet complete electronic business framework for collaborative commerce.” \*
- Replacement for EDI
- ebMS used to send all types of files, not just XML
- Specification is jointly sponsored by OASIS and UN/CEFACT

\* *Professional ebXML Foundations*, Chappell et. al, Wrox Press, 2001

# ebXML vs. Web Services

- Not either/or
- ebXML extends Web Services with a directed vocabulary that caters to B2B needs
- If you were to ask how might web services be extended to accommodate B2B electronic commerce. ebXML would be the answer.

# Is ebXML the Right Choice for the Public Health Information Network?

- Currently in ballot for adoption by HL7
- Endorsed by Gartner in an evaluation of PHIN standards (see previous presentation)
- See [www.ebXML.org](http://www.ebXML.org)

# B2B Application Integration Technology Hype Cycle

Visibility

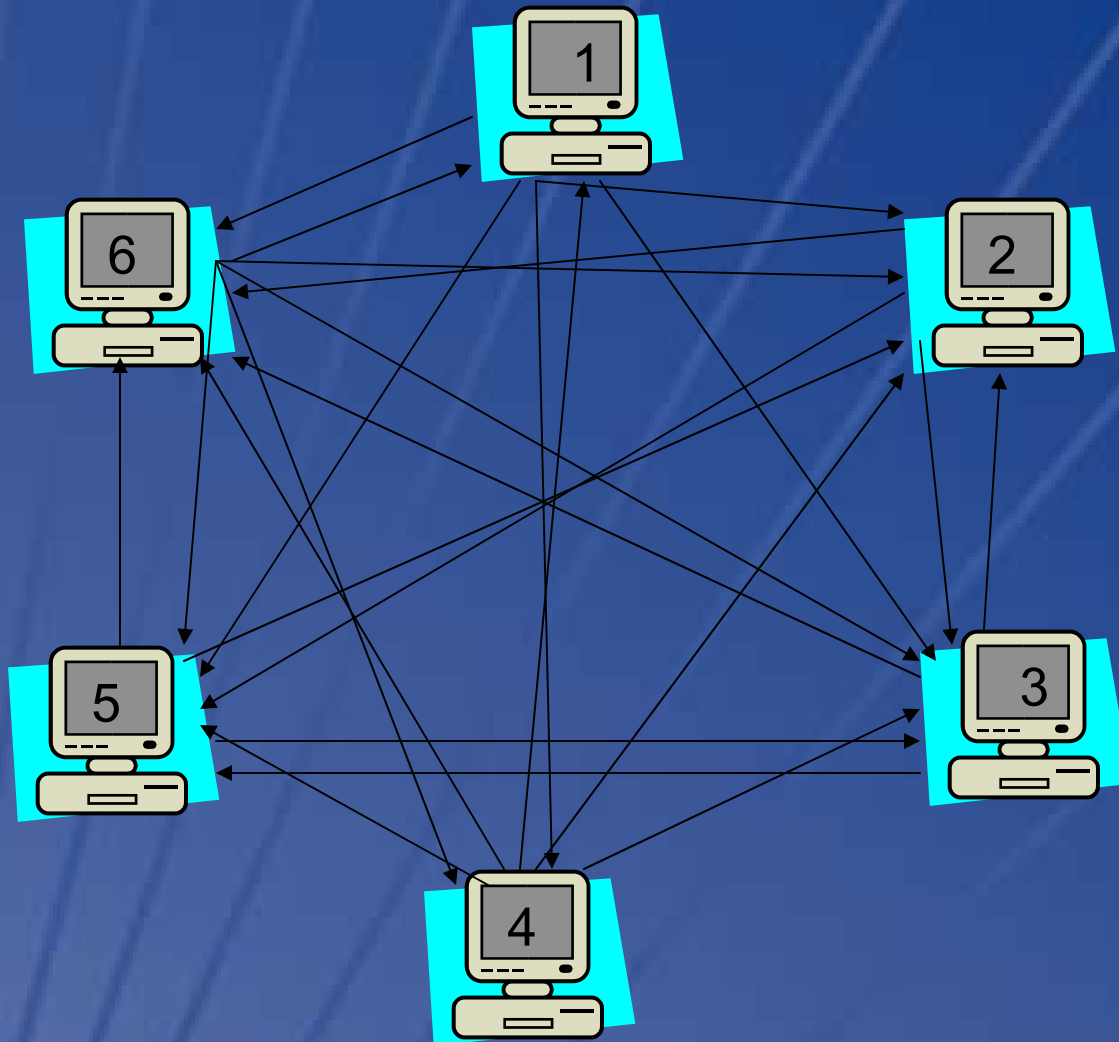

As of March 2003,  
Gartner

# Security Issues

- Security remains a huge stumbling block to the PHINMS vision.
- Transactions between partners are negotiated one by one and stored in a Collaboration Protocol Agreement (CPA)
- SSL is point to point
- No security standards (yet)

# $N*(N-1)$ Problem

# Security Architectures

- Manage  $N*(N-1)$  connections
- Route through a central gateway
- Federated identity management, Liberty Alliance, Federal Bridge, eAuthentication Gateway, Passport, wsSecurity, SAML, .....

# PHINMS

- CDC's Implementation of the ebXML 2.0 message service standards.
- Java based client and server
- Runs on Windows Unix, Linux
- A separable part of the NEDSS Base System

# Interop Testing

- Q3'02 CDC participated in Interop testing with 10 other vendors
- Sponsored by Uniform Code Council (UCC) and hosted by the Drummond Group
- Vendors include Fujitsu, Cyclone, IPNet, Sonic, Sterling, Sun, Sybase, TIBCO and the CDC
- See [www.ebusinessready.org/ebxml.html](http://www.ebusinessready.org/ebxml.html)

# PHINMS Libraries

- Sun - JDK1.4, J2SDKEE1.3, JSSE, JAXM, Javamail, JavaHelp
- IBM XML Security Suite
- Apache Xerces
- Netscape LDAP SDK
- JDBC drivers (Vendor provided)

# PHINMS 2.1 Client

- Capable of sending messages (of any type) from behind firewalls and receiving acks.
- Able to run on a typical workstation as well as a server
- Can poll for messages from a PHINMS 2.1 Server (or other) appropriately configured

# PHINMS 2.1 Server

- Runs on a J2EE Application Server configured as a web service
- Able to receive messages at any time
- Supports queue (DBMS table) based interface or custom message handler
- Will support certificate based, password based or SDN authentication

# Integration Issues

- Designed to work with any number of integration engines, message translators, or application code.
- Hides all aspects of ebXML
- Queue based interface for sending and receiving.
- Queues are SQL, Oracle, Access, etc tables, or file system

# PHINMS Configuration

- Service/Action tag mapped to a message handling service on receiver
- Message handling service can be a web resource (Servlet/JSP/ASP/CGI) or a queue (database table)
- Collaboration Protocol Agreement (CPA)
- Every node needs a CPA with every other node
- Each message hop has an associated CPA
- Describes partner party-ID, end-point, security attributes

# Messaging Topologies

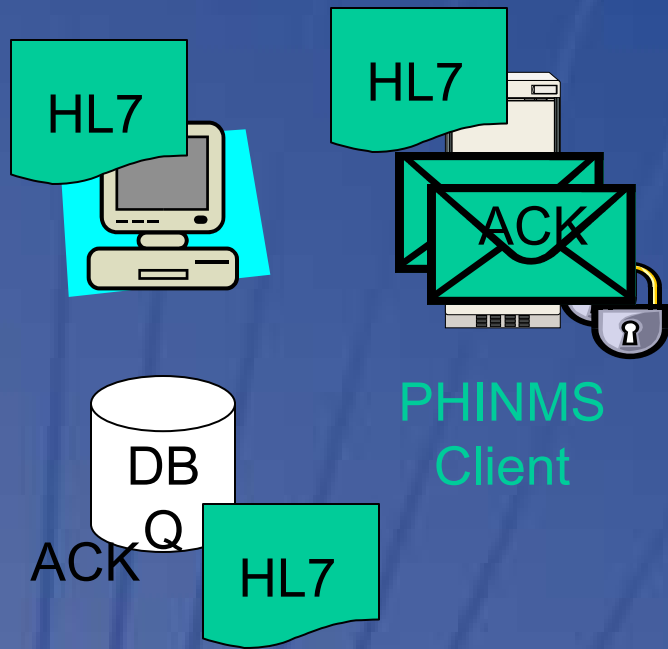

- Direct Send (client/server to server)
- Polling (server to client)
- Route-Not-read (client to client)
- Multi-destination (publish-subscribe, multicast, etc.)

# Direct Send

- Single client sends to server
- Optionally encrypt payload with receivers public key
- No intermediary
- Client behind firewall
- Server configured as a web service

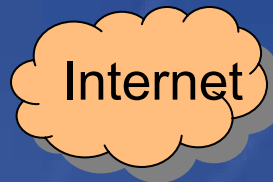

# Direct Send ELR Example

Lab

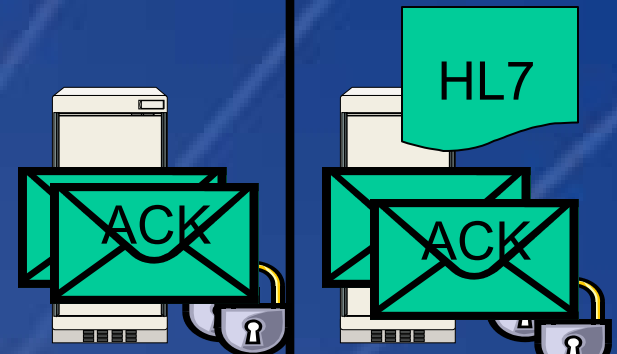

PHINMS  
Client

  
DOH  
Public Key

DOH

  
DOH  
Private Key

Proxy  
Server

PHINMS  
Server

Firewall

Firewall

# Polling

- Server sends to client
- Client polls server for any messages
- Server responds with an acknowledgement with message attached

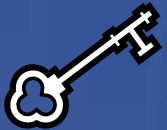

# Polling

Lab

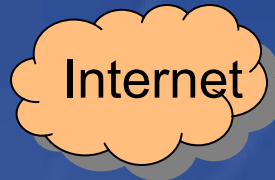

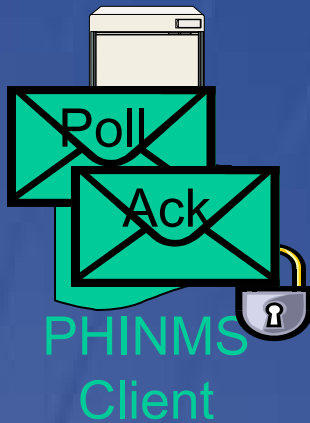

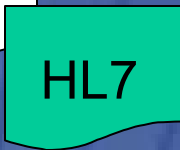

DOH

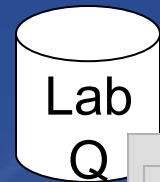

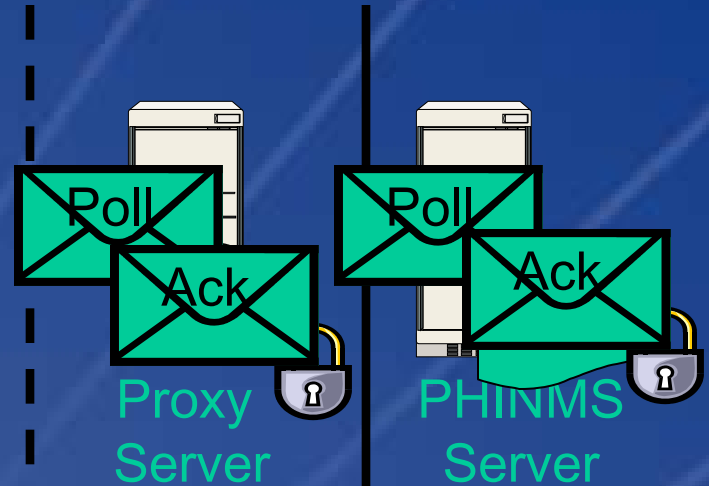

Lab  
Public Key

Lab  
Private Key

Firewall

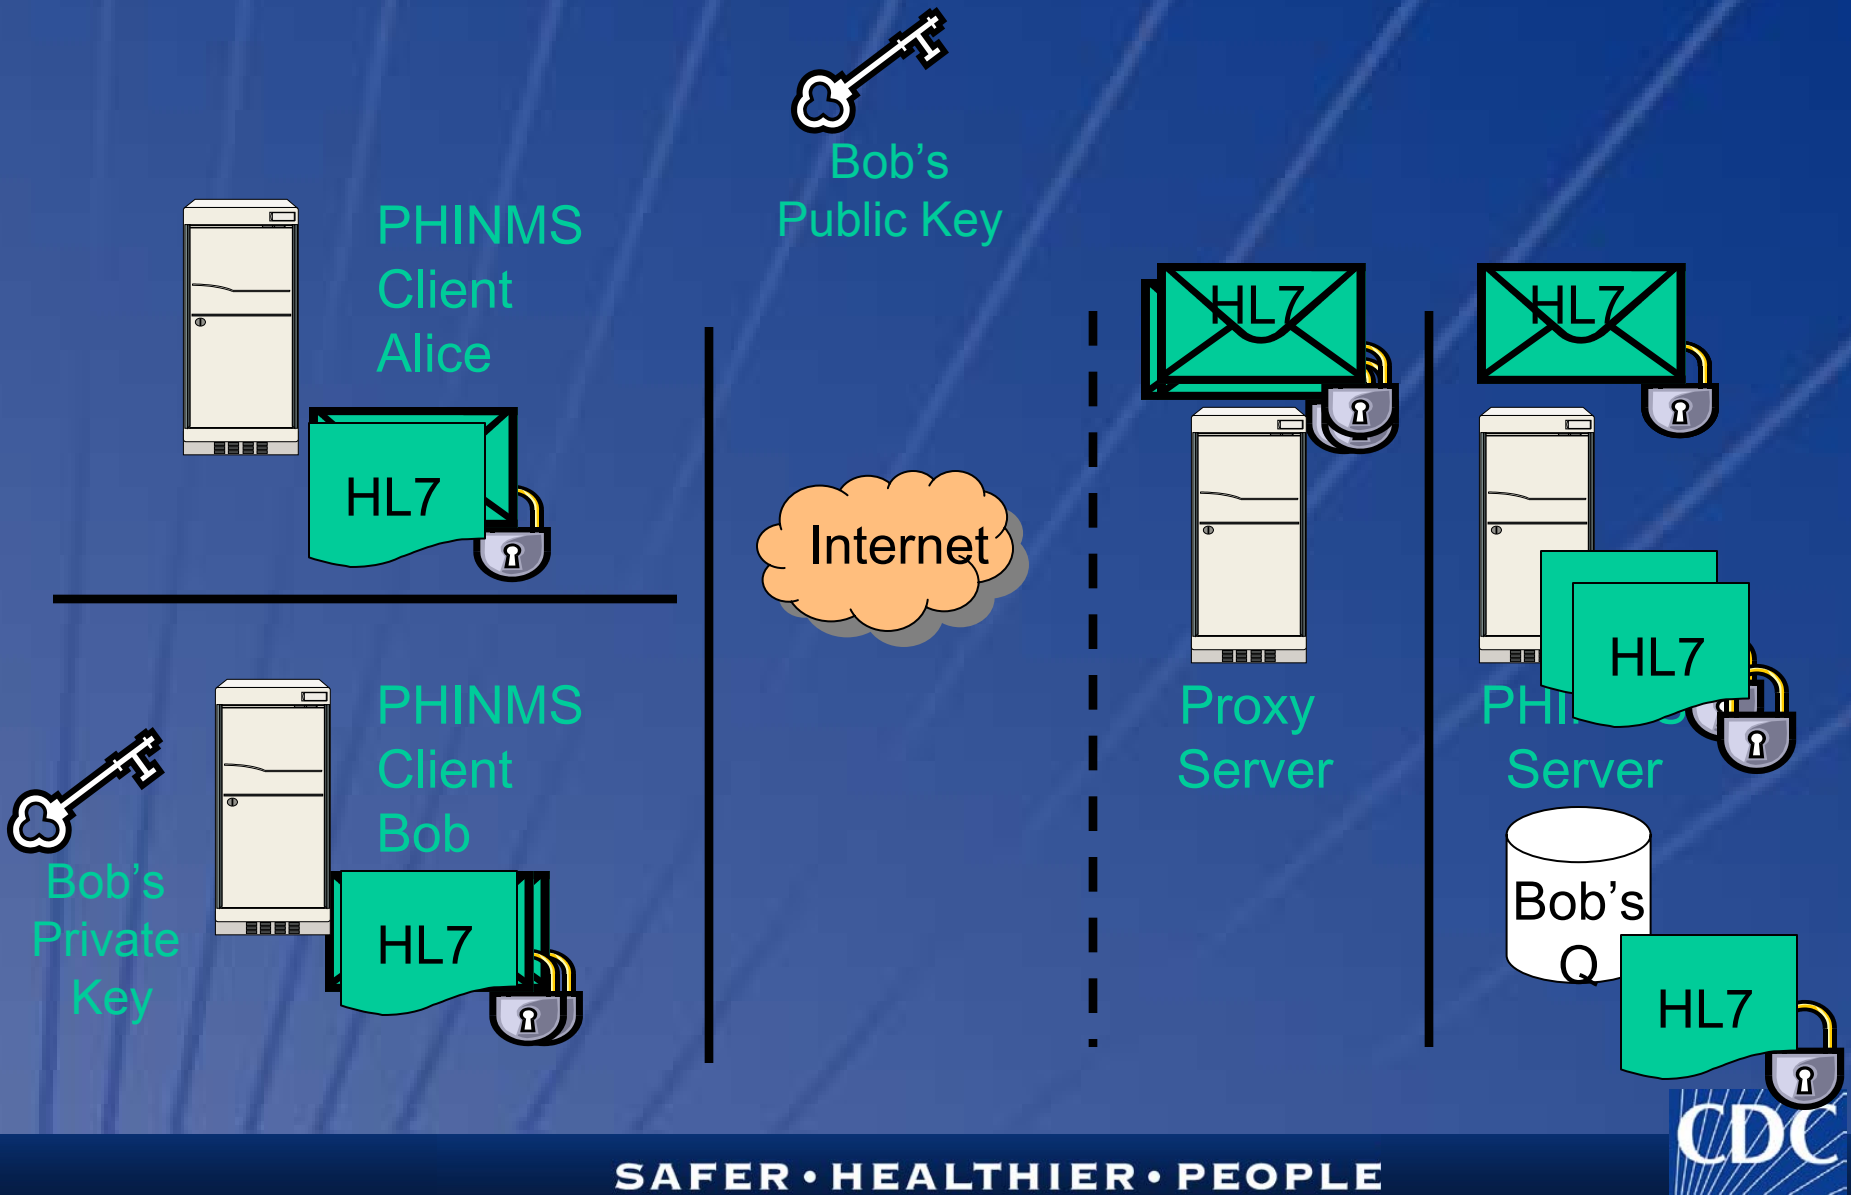

Firewall

# Route-Not-Read or Gateway

- Combine direct send and polling to send between two clients.
- Client “A” sends to client “B” via PHINMS Server “C”
- “A” encrypts the message with “B”s public key so that server “C” can never read it

# Route-Not-Read Alice sends to Bob

# Publish Subscribe/ Broadcast

- Message is sent to server with service actions tags that suggest publish to group
- Publisher looks up group subscribers and sends as appropriate
- Working on encryption key issues

# Interfacing with PHINMS

- Sending Interface: Simple DB table queue, file directory
- Receiving Interface: Simple DB table queue, file directory, custom written message handler (anything callable from a Java environment) often a servlet

# Current Implementations:

- Electronic Lab Reporting from LabCorp to Nebraska DOH
- Nationally Notifiable Disease (NND) messages for Nebraska, testing in Tennessee and South Carolina
- *LRN Results Messenger* 18 labs deployed by May 16
- Planned Implementation in New York State

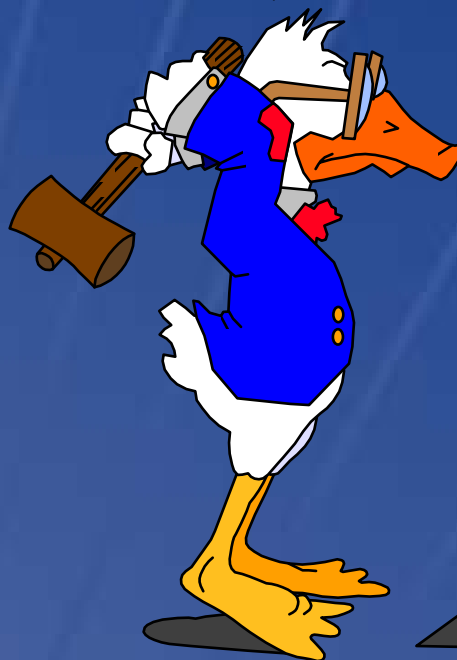

# Current Issues

- Issues with Proxy Servers
- (working on solution, should be forthcoming)
- LDAP Calls blocked at some firewalls
- (work-arounds include locating public key locally) or a web service key retriever)

# Where To Get More Information

- ebXML
- [www.ebxml.org](http://www.ebxml.org)
- Interoperability  
[www.ebusinessready.org](http://www.ebusinessready.org)
- PHINMS Documentation  
[www.cdc.gov/phn](http://www.cdc.gov/phn)
- Request software
- (800) 532-9929 press “2”

**Message? I'll  
send a  
Message!!!!**

***Thanks! I'm PHINished!!!***
